WHAT IS CLAIMED IS:

1. An information processing system comprising:

a first information processing apparatus;

a second information processing apparatus, installed in each of areas, for authenticating said first information processing apparatus in a target area; and

a third information processing apparatus for providing content to said first information processing apparatus;

said first information apparatus, said second information apparatus, and said third information processing apparatus being interconnected via a network;

wherein said first information processing apparatus sends authentication information for authenticating a user and preset area information to said third information processing apparatus via said network;

said third information processing apparatus selects said second information processing apparatus corresponding to said area information obtained from said first information processing apparatus and sends said authentication information obtained from said first information processing apparatus to said selected second information processing apparatus via said network; and

said second information processing apparatus

68

authenticates said first information processing apparatus on the basis of said authentication information received from said third information processing apparatus and sends authentication result information for said first information processing apparatus to said third information processing apparatus via said network.

2. The information processing system according to claim 1, wherein, if said third information processing apparatus determines that the authentication for said first information processing apparatus is permitted by said second information processing apparatus on the basis of said authentication result information supplied from said second information processing apparatus, said third information processing apparatus receives user information for said first information processing apparatus from said second information processing apparatus via said network.

3. The information processing system according to claim 1, wherein said third information processing apparatus transfers each piece of information with said second information processing apparatus in each area by use of a common library.

4. The information processing system according to claim 1, wherein said second information processing

apparatus transfers each piece of information with said third information processing apparatus by use of a common interface in each area.

5. An information processing apparatus comprising:

acquiring means for acquiring authentication information for authenticating a user of first another information processing apparatus and preset area information from said first another information processing apparatus;

selecting means for selecting second another information processing apparatus corresponding to said area information acquired by said acquiring means;

sending means for sending, via said network, said authentication information of said first another information processing apparatus acquired by said acquiring means to said second another information processing apparatus selected by said selecting means; and

receiving means for receiving, via said network, authentication result information for said first another information processing apparatus from said second another information processing apparatus.

6. The information processing apparatus according to claim 5, further comprising:

determining means for determining whether or not authentication for said first another information processing apparatus has been permitted by said second another information processing apparatus on the basis of said authentication result information received by said receiving means;

wherein, if said authentication for said first another information processing apparatus is determined by said determining means to be permitted by said second another information processing apparatus, said receiving means receives user information corresponding to said first another information processing apparatus from said second another information processing apparatus via said network.

7. The information processing apparatus according to claim 5, wherein said area information is a language code and a country code.

8. The information processing apparatus according to claim 5, wherein said sending means and said receiving means are each configured by a library common to said second another information processing apparatus in each area.

9. An information processing method for an information processing apparatus for providing content,

comprising the steps of:

acquiring authentication information for authenticating a user of first another information processing apparatus and preset area information from said first another information processing apparatus;

selecting second another information processing apparatus corresponding to said area information acquired by said acquiring step;

sending, via said network, said authentication information of said first another information processing apparatus acquired by said acquiring step to said second another information processing apparatus selected by said selecting step; and

receiving, via said network, authentication result information for said first another information processing apparatus from said second another information processing apparatus.

10. An information processing apparatus comprising:

receiving means for receiving, via a network, authentication information for authenticating a user of first another information processing apparatus from second another information processing apparatus;

authenticating means for authenticating said first

another information processing apparatus on the basis of
said authentication information received by said
receiving means; and

sending means for sending, via said network,
authentication result information for said first another
information processing apparatus obtained by said
authenticating means to said second another information
processing apparatus.

11. The information processing apparatus according
to claim 10, wherein said receiving means receives
information about a request for user information
corresponding to said first another information
processing apparatus from said second another information
processing apparatus; and

said sending means sends said user information
corresponding to said first another information apparatus
to said second another information processing apparatus
on the basis of the request information received by said
receiving means.

12. The information processing apparatus according
to claim 11, wherein said sending means and said
receiving means are each configured by an interface
common to all areas.

13. An information processing method for an

information processing apparatus installed in each area, comprising the steps of:

receiving, via a network, authentication information for authenticating a user of first another information processing apparatus from second another information processing apparatus;

authenticating said first another information processing apparatus on the basis of said authentication information received by said receiving step; and

sending, via said network, authentication result information for said first another information processing apparatus obtained by said authenticating step to said second another information processing apparatus.

14. An information processing apparatus comprising:

memory area control means for controlling the creation of a memory area corresponding to first another information processing apparatus accessed via a network;

storage means for receiving a content ID from said first another information processing apparatus and storing said content ID into said memory area whose creation has been controlled by said memory area control means;

issuing means for issuing a memory area ID of said

74

memory area in which said content ID is stored and authentication permission information indicative of the authentication of said first another information processing apparatus;

selecting means for selecting second another information processing apparatus corresponding to said first another information processing apparatus on the basis of area information of said first another information processing apparatus; and

sending means for sending, via said network, said memory area ID and said authentication permission information issued by said issuing means to said first another information processing apparatus along with URL information of said second another information processing apparatus selected by said selecting means.

15. The information processing apparatus according to claim 14, wherein, in response to a request for information of said memory area corresponding to said memory area ID received from said second another information processing apparatus, said sending means sends said content ID from said memory area to said second another information processing apparatus via said network;

in response to a request for content information

corresponding to said content ID received from said second another information processing apparatus, said sending means sends said content information to said second another information processing apparatus via said network; and

in response to said request for content corresponding to said content ID received from said second another information processing apparatus, said sending means sends said content to said second another information processing apparatus via said network.

16. The information processing apparatus according to claim 14, wherein said sending means is configured by an interface common to said second another information processing apparatus in each area.

17. The information processing apparatus according to claim 14, wherein, if said content ID received from said first another information processing apparatus has not been stored in said memory area by said storage means or if the deletion of said memory area corresponding to said memory ID has been requested by said second another information processing apparatus, said memory area control means controls the deletion of said memory area corresponding to said first another information processing apparatus.

18. An information processing method comprising the steps of:

controlling the creation of a memory area corresponding to first another information processing apparatus accessed via a network;

receiving a content ID from said first another information processing apparatus and storing said content ID into said memory area whose creation has been controlled by said memory area control step;

issuing a memory area ID of said memory area in which said content ID sent from said first another information processing apparatus is stored and authentication permission information indicative of the authentication of said first another information processing apparatus;

selecting second another information processing apparatus corresponding to said first another information processing apparatus on the basis of area information of said first another information processing apparatus; and

sending, via said network, said memory area ID and said authentication permission information issued by said issuing step to said first another information processing apparatus along with URL information of said second another information processing apparatus selected by said

77

selecting step.

19. An information processing apparatus comprising:

receiving means for receiving, from first another information processing apparatus, via a network, a memory area ID corresponding to said first another information processing apparatus in second another information processing apparatus and authentication permission information indicative of being authenticated by said second another information processing apparatus;

acquiring means for acquiring, on the basis of said memory area ID and said authentication permission information received by said receiving means, a content ID stored in a memory area corresponding to said memory area ID and content information corresponding to said content ID from said second another information processing apparatus via said network; and

sending means for sending said content information acquired by said acquiring means to said first another information processing apparatus.

20. The information processing apparatus according to claim 19, further comprising:

determining means for determining, when said receiving means has received an instruction for

78

purchasing a sale service of said content ID from said
first another information processing apparatus, whether
or not said instruction for purchasing said sale service
corresponding to said content ID has been received by
said receiving means;

wherein, if said instruction for purchasing said
sale service corresponding to said content ID is found
received by said determining means, said acquiring means
acquires said content corresponding to said content ID
from said second another information processing apparatus
via said network.
